PROJECT DEVELOPMENT PHASE

PERFORMANCE TESTING REPORT

Global Olympic Sports Performance Analysis Using Tableau

Prepared for: Project Performance Testing Template
Project owner: Aradhana Nagar
Team ID: To be provided
Report date: 2 November 2026

Scope and evidence note

This report fills both supplied templates (Tableau and Snowflake). It uses the project details and dataset facts available in the conversation. Actual stopwatch timings, query-history logs, screenshots, machine specifications and Snowflake execution records were not supplied. Therefore, no measured performance values or screenshots have been invented. Items requiring live testing are clearly marked as Pending / Not applicable.

Project overview

The project analyzes historical Olympic athlete and medal information using Tableau. The available athlete-level CSV contains 271,116 records and 15 columns, covering 1896–2016 and both Summer and Winter Games. Key fields include athlete ID/name, team, NOC, Games, Year, Season, City, Sport, Event and Medal. The supplied data does not include 2020–2026 records, region mapping, host-country lookup or sports-investment values.

Project detail	Value
Project name	Global Olympic Sports Performance Analysis Using Tableau
Team ID	To be provided (not present in supplied materials)
Maximum marks	As specified by the instructor; not provided
Primary platform	Tableau
Available dataset	Athlete-level Olympic CSV; 271,116 rows × 15 columns; 1896–2016
Snowflake	Not evidenced as implemented; Snowflake template completed as a status/validation record

1. TABLEAU PERFORMANCE TEST

The Tableau template is completed below. The project design contains three dashboards with nine planned visualizations and a four-point Tableau Story. The status column distinguishes known project configuration from performance measurements that still need to be captured during a live run.

S.No. / Parameter	Screenshot / Values / Test result
1. Data Rendered	**Dataset:** 271,116 records; 15 columns; Olympic years 1896–2016; Summer and Winter seasons. **Validation:** Dataset details are known from the supplied project data. Dashboard load time, extract size and render duration were not recorded. **Measured timing: Pending.**
2. Data Preprocessing	The analysis uses athlete-level Olympic records and medal-related calculations. A medal flag can be defined as: IF NOT ISNULL([Medal]) AND [Medal] <> 'NA' THEN 1 ELSE 0 END. Medals per athlete can be calculated as SUM([Medal Flag]) / COUNTD([ID]). **Important:** Team/event medals may repeat across athlete rows; validate distinct medal/event keys before reporting official medal totals. A complete executed cleaning log was not supplied, so null/duplicate/standardization test counts are **Pending verification**.
3. Utilization of Filters	Project filter fields: **Year, Season, NOC, Sport and Medal**. Region filter is conditional on adding a reliable region mapping. Test each filter individually and in combination; verify that all worksheets update correctly and that clearing filters restores the full view. Actual response times for filtered/unfiltered views were not recorded: **Pending measurement**.
4. Calculation Fields Used	Known/discussed calculations include **Medal Flag** and **Medals per Athlete**. A distinct medal key / host medal key was also discussed for medal counting and host analysis; its final formula and validation results were not provided. Confirm calculations against a small manually checked sample before final submission.
5. Dashboard Design	**3 dashboards; 9 visualizations planned:** Dashboard 1 – National Olympic Performance (3 views): average medals per athlete by sport; country/NOC medal ranking; medal distribution by sport. Dashboard 2 – Sports Investment and Regional Efficiency (3 views): investment vs medal performance; regional medal efficiency; country-wise medal efficiency. Dashboard 3 – Olympic Trends and Storytelling (3 views): medal trends by year/season; host nation comparison; regional medal distribution by sport. **Limitations:** investment, host and regional analyses need supporting data not present in the base CSV. Those views must be marked as pending or built only after verified supplementary data is joined. Actual dashboard render time: Pending.
6. Story Design	**4 Tableau Story points:** (1) Olympic Games – Project Overview; (2) Scenario 1 – National Olympic Committee Performance Strategist (Priya); (3) Scenario 2 – Sports Investment Analyst (Carlos); (4) Scenario 3 – Olympic Data Storyteller (William). The story structure is reported as created in the project discussion. Story navigation/render timing and screenshot evidence were not supplied.

Tableau performance test checklist

Test	Expected result	Status
Open each dashboard	All charts load without blank/error views	Live timing pending
Apply Year / Season filter	Relevant views update consistently	Verify in Tableau
Apply NOC / Sport / Medal filters	Correct subset appears; clearing restores all data	Verify in Tableau
Check calculations	Medal counts and per-athlete ratios match validated sample	Formula/sample validation pending
Navigate all story points	All four story points open and display intended content	Structure reported; screenshot pending

2. SNOWFLAKE PERFORMANCE TEST

The supplied Snowflake template is included, but the project information available here confirms a Tableau-based workflow only. No Snowflake database, warehouse, schema, tables, executed SQL logs or query-history export were provided. This section is therefore completed honestly as Not Implemented / Not Applicable rather than presenting fabricated Snowflake metrics.

S.No. / Parameter	Screenshot / Values / Test result
1. Data Rendered	**Tables loaded:** No Snowflake tables evidenced. **Records and storage size:** Not applicable / not available. Source data available for Tableau: 271,116 rows × 15 columns in the athlete-level CSV. This is not a Snowflake table-load result.
2. Data Preprocessing & Quality	The template asks for null checks, duplicate checks, trimming, standardization and cleaning. No Snowflake SQL execution evidence or quality-check counts were supplied. These checks are **Not run in Snowflake**. If Snowflake is added later, record row counts before/after cleaning, null counts by key column, duplicate counts, and standardization results.
3. New Fields Created	No Snowflake fields/columns are confirmed as created. Tableau calculations discussed for the project include Medal Flag and Medals per Athlete; these should not be reported as Snowflake columns unless actually created there.
4. Filter Efficiency Test	Snowflake filter/query performance comparison: **Not applicable** because no Snowflake queries or warehouse are evidenced. Tableau filters are documented in the Tableau section. No query timing has been fabricated.
5. Dashboard & Visualization Testing	The project dashboard platform is Tableau: 3 dashboards and 9 planned visualizations, with a 4-point Story. No Snowflake dashboard or Streamlit application is evidenced. Snowflake dashboard count: **0 confirmed**.
6. Query History	Query with highest execution time: **Unavailable** – no Snowflake query-history export or execution log supplied. Attach a query-history screenshot/export only if Snowflake is implemented and queries are executed.

3. OVERALL PERFORMANCE SUMMARY

Area	Current project evidence	Action before final evaluation
Data volume	271,116 rows; 15 columns; 1896–2016	Capture extract/file size and actual load duration
Tableau dashboards	3 dashboards; 9 planned views	Open each dashboard and record load/render time; attach screenshots
Tableau Story	4 story points reported created	Capture full story navigation screenshots
Data quality	Calculations and validation approach documented; executed test counts unavailable	Record null, duplicate and medal-key validation results
Supplementary data	Region, host and investment data absent from base CSV	Add reliable sources and document join keys, or label views as proposed
Snowflake	No implementation evidence supplied	Keep N/A, unless a real Snowflake workflow is implemented and tested

4. FINAL OBSERVATIONS & RECOMMENDATIONS

1. The core Tableau analysis can use the supplied historical athlete dataset, but medal totals must be validated to avoid counting team medals repeatedly for each athlete.
2. Do not label the dataset as covering 1992–2026; the supplied file coverage is 1896–2016.
3. Do not report investment, region or host insights as factual until suitable supplementary datasets have been added and checked.
4. For actual performance testing, record dashboard load time, filter response time, story navigation time, data extract/file size, and screenshots on the computer used for evaluation.

5. Leave Team ID and maximum marks as “To be provided” / instructor-defined rather than inventing values.
