Project: Global Olympic Sports Performance Analysis Using Tableau

The journey below represents how the three stakeholder personas use the Olympic analysis solution, from identifying a question to interpreting and acting on dashboard insights.

Journey element	Stage 1 – Identify needs	Stage 2 – Explore dashboards	Stage 3 – Interpret & act
Actions	Priya defines sports and country performance questions; Carlos identifies funding evaluation needs; William plans an Olympic trend story.	Users open the relevant dashboard, choose year/season/country/sport filters, inspect charts and tooltips.	Priya identifies sports for further review; Carlos compares verified investment and outcomes; William develops evidence-based narratives.
Touchpoints	Project brief, stakeholder requirements, athlete_events.csv and supplementary lookup datasets.	Tableau dashboards, filters, KPI labels, tooltips, Tableau story and (planned) Flask web interface.	Dashboard exports/views, Tableau story, project report and demonstration video.
Customer thought	“Which measures and data will answer my question? Are the data complete and trustworthy?”	“Which countries, sports or regions stand out? How do results change when I filter the data?”	“What does the evidence mean, what are the limitations, and what action is justified?”
Customer feeling	Curious but may feel uncertain because data is spread across files and years.	More confident when charts are clear; frustrated if filters, labels or missing data are confusing.	Satisfied when insights are transparent and reproducible; cautious where supporting data is incomplete.
Process ownership	Project analyst (Aradhana Nagar) collects data, confirms stakeholder questions and checks source quality.	Project analyst builds and tests Tableau calculations, nine visualizations, three dashboards and four story points.	Stakeholders interpret results; project analyst documents assumptions, validates findings and prepares the presentation.
Opportunities	Provide a data dictionary, confirm date coverage, obtain region/host/investment sources and define medal-counting rules.	Use consistent colours, readable titles, responsive layouts, clear filters and distinct medal counting; test dashboard speed.	Show definitions and source notes, avoid unsupported claims, add newer Olympic data when available and explain that correlation does not prove causation.

Important data limitation: The supplied athlete_events.csv contains Olympic records through 2016. It does not include sports-investment or region fields. Investment comparison and regional analysis require verified supplementary datasets; host-country analysis requires a host lookup. Do not report 2020–2026 results until the relevant records are added.
