Project Design Phase-I
Problem – Solution Fit Template

Date	1 November 2026
Team ID	To be provided
Project Name	Global Olympic Sports Performance Analysis Using Tableau
Maximum Marks	2 Marks

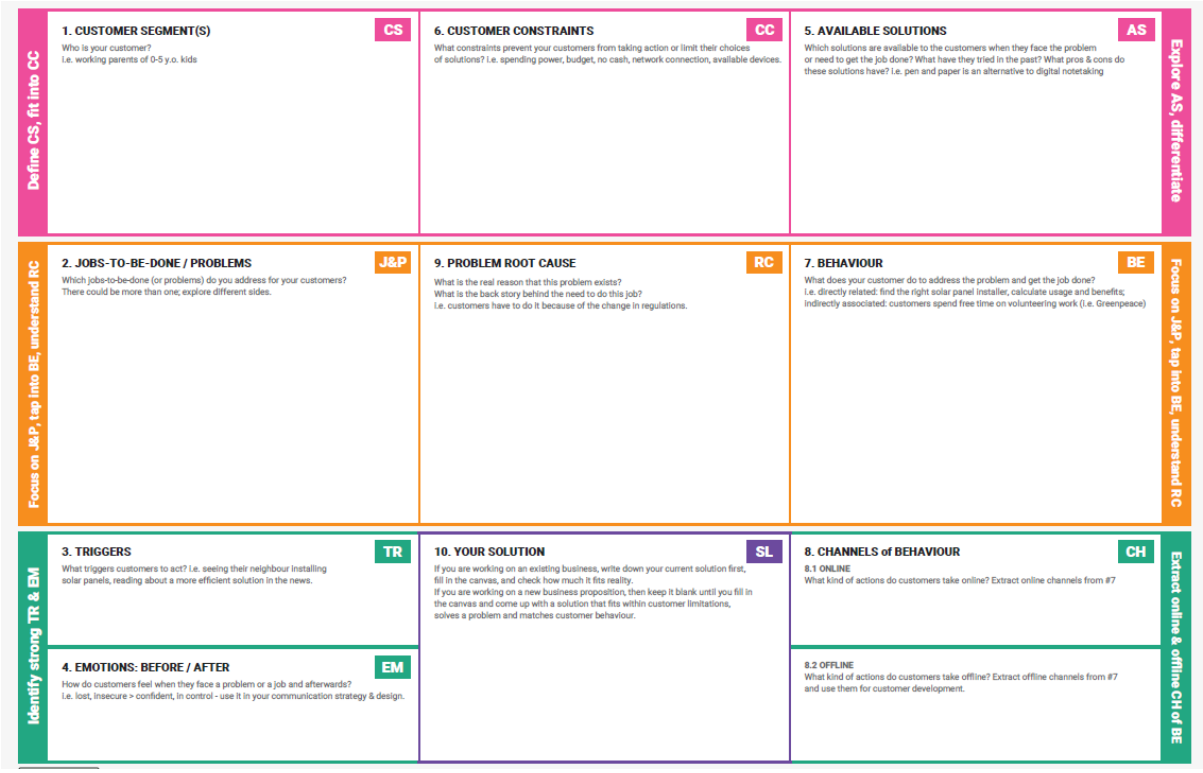

Problem – Solution Fit Template

The Problem-Solution Fit simply means that you have found a problem with your customer and that the solution you have realized for it actually solves the customer's problem. It helps entrepreneurs, marketers and corporate innovators identify behavioral patterns and recognize what would work and why

Purpose:

Solve complex problems in a way that fits the state of your customers.
Succeed faster and increase your solution adoption by tapping into existing mediums and channels of behavior.
Sharpen your communication and marketing strategy with the right triggers and messaging.
Increase touch-points with your company by finding the right problem-behavior fit and building trust by solving frequent annoyances, or urgent or costly problems.
Understand the existing situation in order to improve it for your target group.

Problem-Solution Fit Canvas

1. Customer Segment(s)

National Olympic Committee performance strategists; sports investment and funding analysts; Olympic broadcasters, journalists, and data storytellers; sports researchers and policy makers.

2. Jobs-to-be-Done / Problems

Compare countries' medal performance; identify sports with stronger medal outcomes; examine athlete participation and medal trends; assess host-nation results; understand regional performance; relate funding to medal outcomes when reliable investment data exists.

3. Triggers

Upcoming Olympic planning cycles; grant and budget allocation periods; publication of new Olympic results; preparation of sports policy; media documentary or reporting deadlines; questions about home advantage or emerging nations.

4. Emotions: Before / After

Before: overwhelmed by large datasets, uncertain about comparisons, and dependent on manually prepared reports. After: clearer understanding through interactive charts, transparent metrics, and accessible dashboards. These are expected user outcomes to validate with actual users.

5. Available Solutions

Spreadsheets, official Olympic reports, static charts, manually prepared presentations, and separate sports databases. These can be useful but may require substantial manual work and may not offer consistent interactive comparisons.

6. Customer Constraints

Data may be incomplete or inconsistent across years; different sources may use different country codes and medal definitions; investment data may be difficult to obtain; users may have limited Tableau access or technical skills; current dataset ends in 2016.

7. Behaviour

Users search historical results, compare country tables, review sport-specific medal counts, filter years and seasons, and prepare reports or presentations. Analysts may combine medal records with budgets and regional classifications.

8.1 Channels of Behaviour – Online

Tableau dashboards and stories; official Olympic data portals; downloadable CSV datasets; published reports; Flask-hosted project interface; online presentations and documentation.

8.2 Channels of Behaviour – Offline

Committee planning meetings; funding review sessions; sports policy discussions; university/project demonstrations; media editorial meetings and presentations.

9. Problem Root Cause

Olympic information is high-volume and distributed across athlete, event, country, sport, and year dimensions. Raw records are not immediately suitable for decision-making, and supplementary data such as investment and region may be stored separately.

10. Your Solution

A Tableau analytical project with prepared Olympic data, clearly defined medal metrics, nine visualizations, three interactive dashboards, and a four-scene story. Optional verified investment, region, and host lookup datasets extend the analysis. A Flask interface can embed published Tableau views.

How the Solution Fits the Problem

The solution converts raw records into comparable views for the three identified stakeholder groups. Priya receives sport and country comparisons; Carlos receives investment and regional comparisons when supporting data is supplied; William receives time trends, host comparisons, and regional distribution. Metric definitions, source coverage, and limitations are displayed so that users can interpret findings responsibly.
